Protect your home against RODENT invasion.

The house mouse is the number one household rodent pest in all parts of the country, urban and rural areas as well. A single mouse eats only about 3 grams of food per day (8 pounds per year), but because of their habit of nibbling on many foods and discarding partially eaten items, the amount of food contaminated is about ten times greater. Nibbling and gnawing of electrical wires can lead to house fires. Droppings can cause salmonella and pulmonary disease.

Mice are sexually mature as early as 6 to 10 weeks old and may breed year-round. In perfect conditions, a nest of mice can deposit 18,000 droppings and produce 2,500 heirs in a six-month period. Infestations may be linked as a catalyst for the spreading of many diseases that are harmful to humans. Winter rodent programs typically run from November through March but are available year round. Exterior Vole and Rodent programs may be appropriate in the control effort against unhealthy rodent populations on your property. Vole and Rodent programs typically run April through November but are available year round. Contrac an Anti-coagulant rodenticide acts as an attractive food source which will usually be accepted by the colony within 5 to 7 days. Contracs active ingredient Bromadiolone is contained within the rodent blocks which are made of a paraffin wax. Bell Labs the makers of Contrac, have been in the business since 1925. Feel free to ask about our products and services on the contact us page or simply call us today for an evaluation. Thank you.
