EARLY SPRING TICK CONTROL MEMO

As Spring approaches we are all readying ourselves for warm weather, and fun in the sun. Our island is very beautiful at this time of year. We all so look forward to losing our heavy jackets and enjoying outdoor activities.

However with all of this excitement we must also be careful to protect our families from Tick born disease. This year I am hoping to bring to the attention of our customers the truth, in that a large portion of the tick population is trafficked around your property on the backs of **RODENTS**. By controlling the rodent population we may drastically improve our level of control. We have available Vole and Rodent programs which run April through November and also year round. These programs are very modestly priced and in addition to helping in the fight against Lyme disease they are effective in keeping disease carrying rodents themselves out of your home.

Also important is the fact that during March, April, and May along with the fall months of the year is when local Tick species reproduce the most. We recommend you start your programs as early as possible in order to achieve control by the time it matters most. Our best chance for success when it comes to the control of disease carrying Ticks is that we are all educated and work together. At East End Pest Management your families safety is #1, we will stop at nothing to protect your most valuable assets. We wish for everyone to have a happy healthy Spring.

Please call for more information on this topic and about our other products and services. Thank you for choosing East End Pest management.
