TO EFFECTIVELY MANAGE PESTS DURING THE SUMMER YOU MAY WANT TO START IN THE WINTER... (let me explain)

Winter is approaching. Although some of us have left the East End for the season, many of our homes will continue to have pest control issues. Heated homes are the perfect place for insects, spiders and rodents to survive over the winter months.

East End Pest Management has some great winter services and programs that will help control these pest populations.

INSECTS AND SPIDERS:

Insects and spiders invade the structure of your home during the warm months of the year, creating nests in the walls. This is where they survive the cold winter months, reproducing in the warmth of your home. These are the same spiders and insects you see emerging in the spring. Controlling the population over the winter months will result in achieving a higher level of control over the summer.

Effective control of the insect and spider populations in your home starts over the winter months with a monthly Interior/Exterior spray. Yearly service available.

RODENTS:

Every home has rodents! If you allow a rodent population to grow to the point where " you see something" then you may already be in **danger**. The house mouse is the **#1** rodent pest in all parts of the country, urban and rural areas as well. Mice are sexually mature at 6 to 10 weeks old and may breed year round. In perfect conditions, a nest of mice can deposit 18,000 droppings and produce 2,500 heirs in a six month period. Droppings can cause salmonella and pulmonary disease. Infestations may be linked as a catalyst for the spreading of many diseases that are harmful to humans.

You can control the rodent population in your home with a Winter Rodent Program. This 5 month program runs from November through March. Customized and Yearly service programs available.
