Many Hamptons homeowners have, at this point, closed their homes for the Winter season. In turn, some of us prepare for the Winter months ahead, as more of us than ever are using our seasonal homes year-round. After many months of landscaping, pool maintenance, and various other service providers including Pest Control, it is common for some to leave their homes for the Winter unattended. Many believe Pest issues do not affect our East End homes during the Winter months. This could not be further from the truth. It is at this time that Rodents, Insects and Spiders are actively seeking shelter for the colder months to come. Don't let pest issues devastate your home while you are away, or even worse, while you are there.

To effectively manage pests during the Spring and Summer months, East End Pest Management recommends you continue your Pest Control services through Fall and Winter.

We will often say: If you allow a Rodent population to grow to the point where, " you see something", then you may already be in danger. Small burrowing rodent species are the #1 invader pests in all parts of the country, urban and rural areas as well. Mice are sexually mature at 6 to 10 weeks old and may breed year-round. In perfect conditions, a nest of mice can deposit 18,000 droppings and produce 2,500 heirs in a six-month period. Bacteria in droppings resulting from infestations may be linked as the catalyst for the spreading of many diseases that are harmful to humans. Rodents have also been known to "gnaw" or chew unprotected electrical wiring which can cause house fires. This is why we urge our customers to keep their homes protected during the Fall and Winter months as an infestation and potential damage can be all but inevitable if left unattended. Our Interior and Exterior maintenance programs are available year-round and will help make sure this never happens to your home.

Rodents, Insects and Spiders are actively seeking shelter for the colder months to come:

Insects and spiders invade the structure of your home during the warm months of the year. It is during this time that they will create nests in our walls. When structural Pest Control services cease some remaining living insects and spiders will enter. These are the same spiders and insects you see emerging in the spring. Many of us who continue to live in our homes throughout the Winter season may even continue to experience active populations of insects and spiders as they survive the cold winter months, reproducing in the warmth of your home. Constant control during the Fall and Winter months will result in achieving and/or maintaining a higher level of control come Spring and Summer.

East End Pest Management offers a range of services that effectively control the pest population throughout the year. Contact us today to create your customizable program for control of rodents, insects and spiders. Call Today!
