Rodent Information:

The house mouse is the number one invader pest in all parts of the country, urban and rural areas as well. A single mouse eats only about 3 grams of food per day (8 pounds per year). However, because of their habit of nibbling on many foods and discarding partially eaten items, the amount of food contaminated is about ten times greater. Nibbling and gnawing of electrical wires can lead to house fires. Droppings can cause salmonella and pulmonary disease. Mice are sexually mature as early as 6 to 10 weeks old and may breed year-round. In perfect conditions, a nest of mice can deposit 18,000 droppings and produce 2,500 heirs in a six-month period. Infestations may be linked as a catalyst for the spreading of many diseases that are harmful to humans.

Our Treatment and Services:

It is recommended to maintain a proactive approach to Rodent Control on your property, rather than a reactive one. Droppings and contaminants created by interior Rodent infestations can have lasting negative effects on your home and family.

Damage inflicted to ornamentals and turf outside can be fatal to expensive plantings. Perhaps an inspection is in order? Our licensed technicians can provide full and thorough inspections to ascertain population levels within your home and property. Our programs utilize tamper resistant baiting stations which contain an attractive food source and anti coagulant rodenticide. Placement of boxes and frequency of visits are based on the needs of the customer. "Five Visit" interior Rodent control programs may be necessary to battle an established interior infestation. Exterior Rodent Control programs such as "Year round Vole and Rodent", or "Seasonal Vole and Rodent" programs are designed to help us keep control of rodent populations around your property at all times, preventing the unhealthy numbers that cause rodents to enter your structure.

Products:

We use Tamper resistant bait stations that are designed to safely house rodent control products, like **CONTRAC**® a widely used Rodenticide. This highly attractive food source will usually be accepted by the colony within 5 to 7 days. The active ingredient in **CONTRAC**®, Bromadiolone, is contained within the rodent blocks which are made of a paraffin wax. Bell Labs - the makers of **CONTRAC**®, have been in the business since 1925. We also offer a number of other Rodent control products as well as organic-use rodenticides like **TERAD AG**®. For customers who require added security we offer covers designed to keep your rodent control boxes safe. Rodent control is necessary, **Baiter - Aid**® box covers will help to keep your pets and children safe during the process.
